# WORLD COIN ($WDC)

A Community-Driven Digital Asset Building a New Ecosystem

Version 1.0 | 2026

## Executive Summary

World Coin ($WDC) is a community-driven digital asset built around the revival of the World Coin name and its history, while establishing a new foundation on Solana.

The current $WDC is a newly launched SPL token created in 2026. It is technically separate from the original World Coin blockchain launched in 2013. The connection is the name, history, and spirit of revival, not a blockchain migration or token conversion.

The project begins with a simple principle: Build in public. Be transparent about what exists. Develop what comes next deliberately.

$WDC was launched publicly through Pump.fun without a presale, private investor allocation, or team token reserve. This structure gives the project a straightforward starting point: ownership is open to the market, development is visible to the community, and future growth depends on execution and participation rather than predetermined promises.

The long-term direction of $WDC is intentionally broader than a single product. The goal is to establish an ecosystem around the token that can evolve through community participation, experimentation, and real development.

### The Starting Point

The original World Coin emerged in 2013 as an independent cryptocurrency project. More than a decade later, the name remains part of cryptocurrency history, but the original project became largely dormant.

The 2026 revival introduces $WDC to a new generation through Solana. This is not an attempt to rewrite that history. It is an attempt to continue the story.

# Vision & Mission

## Vision

To build an open, community-driven ecosystem around $WDC, combining digital ownership, experimentation, products, and community participation into a platform that can evolve over time.

## Mission

The project aims to:

- Build a sustainable foundation for a growing digital ecosystem
- Create products and experiences that give the community reasons to participate
- Encourage open and transparent development
- Maintain a fair and accessible token structure
- Support community-led growth and experimentation
- Explore practical applications for $WDC as the ecosystem develops
- Evolve alongside the needs and ideas of its users

The project does not claim that every future application has already been decided. That is intentional. The ecosystem will be shaped by development, user feedback, market conditions, and the opportunities that emerge as WDC grows.

# Fair Launch Model

The foundation of the current $WDC is its public launch structure.

- No presale • There was no private presale before the public launch.
- No private investor allocation • No venture capital or private investor allocation was reserved as part of the launch structure.
- No team token reserve • The stated tokenomics allocate 0% of the total supply to a team allocation.
- Public availability • The token was launched publicly through Pump.fun.

## Why Start Again?

Crypto moves quickly. Projects appear, disappear, change names, and are often forgotten within a few market cycles.

WDC has something unusual: history. The original World Coin existed long before the current revival. The 2026 project does not claim to be the continuation of the original blockchain itself. Instead, it uses that history as the starting point for something new.

The objective is not to manufacture legacy. The objective is to build on top of an existing story while creating a new one.

# The Ecosystem

The WDC ecosystem is the broader environment being developed around the $WDC token and its community.

It is not limited to one application. Instead, the ecosystem can include products, digital experiences, community initiatives, infrastructure, integrations, and other applications developed over time.

Some components may be experimental. Some may become permanent. Others may be discontinued if they do not create meaningful value.

This flexibility is intentional. A strong ecosystem should be able to adapt rather than become trapped inside a roadmap written before its users exist.

# Development Philosophy

### 01. Build before overpromising

Ideas are not presented as finished products. Development milestones will be communicated according to actual progress.

### 02. Community participation matters

The ecosystem is designed to grow with its community rather than operate entirely behind closed doors. Feedback, participation, and experimentation can influence future development.

### 03. Transparency over hype

Market conditions can change quickly. Development can take longer than expected. Products can fail. WDC intends to communicate those realities rather than hide them behind aggressive promises.

### 04. Evolution over rigidity

The first version of the ecosystem does not need to be its final version. As products are tested and users interact with them, the strongest directions can receive more attention and resources.

# The Opportunity

The cryptocurrency industry has produced significant technological innovation, but many projects struggle to move beyond speculation. At the same time, users increasingly expect digital assets to exist within broader ecosystems rather than as isolated tokens.

This creates an opportunity for WDC. Instead of defining the entire future of the project around one predetermined application, the ecosystem can develop through multiple stages.

The token provides the common foundation. The community provides participation. Development provides the infrastructure. Products provide the experiences. And adoption determines which parts of the ecosystem deserve to grow.

# Current Development

The WDC ecosystem is in its early stage. The project is currently focused on establishing its identity, community, infrastructure, and first products while exploring longer-term directions.

Development is intentionally incremental. Rather than presenting an extensive list of future products as guaranteed, WDC will introduce new components as they become sufficiently developed to share with the community.

If it is announced, it should have a path toward becoming real.

# Ecosystem Roadmap

The roadmap represents development direction rather than a promise that every listed milestone will occur exactly as described.

## Phase 1 — Foundation

Completed / Ongoing

- Public token launch
- Community formation
- Brand identity development
- Official website
- Public documentation
- Market transparency
- Early ecosystem experimentation

## Phase 2 — Product Development

Current / Next

- Continue developing the WDC ecosystem
- Release initial products and experiences
- Improve the user experience
- Establish supporting infrastructure
- Gather community feedback
- Test potential ecosystem applications

Products will be introduced progressively rather than all at once.

## Phase 3 — Ecosystem Growth

Future

- Expand the range of ecosystem applications
- Increase community participation
- Develop strategic integrations
- Improve infrastructure
- Establish stronger onboarding experiences
- Encourage independent community contributions

## Phase 4 — Expansion

Future

- Mobile-first experiences
- Broader ecosystem integrations
- Additional infrastructure
- Community-driven initiatives

- Improved ecosystem accessibility
- New applications based on demonstrated demand

### Phase 5 — Scale

Long Term

- Wider ecosystem adoption
- Strategic partnerships
- Additional integrations
- Expansion into new markets and communities
- Continued product development
- Evolution toward a mature community-driven ecosystem

Specific applications and partnerships will be announced when they are sufficiently developed or confirmed.

## The Principle Behind the Roadmap

The WDC roadmap is not designed to create the illusion that everything has already been figured out. It is a framework for progression.

Foundation → Products → Community → Ecosystem → Scale

Each stage should earn the right to move into the next.

# Tokenomics

## Core Principle: Public Distribution

Total Supply: 1,000,000,000 $WDC
Distribution: 100% public
Team Allocation: 0%
Investor Allocation: 0%
Presale: None

The current token structure is designed around a public launch model rather than private allocation. There are no stated team or investor vesting schedules.

Market price is determined by market supply and demand. As with any cryptocurrency, market conditions can change rapidly and participation carries significant risk.

# The Role of $WDC

At this stage, $WDC should be understood as the native digital asset around which the WDC ecosystem is being developed.

The project's long-term applications are still evolving. Rather than assigning a fixed list of utilities before they are fully developed, WDC intends to introduce ecosystem applications progressively.

Potential applications may be explored through future development, community initiatives, products, integrations, and other experiences. Any significant utility will be communicated when it moves beyond the conceptual stage.

A future idea is not presented as a current product.

# Ecosystem Economics

Long-term ecosystem sustainability will depend on the relationship between development, participation, and demand.

Potential future revenue mechanisms may be explored where appropriate to support:

- Product development
- Infrastructure
- Ecosystem growth
- Community initiatives
- Maintenance and operations

No single revenue model is being presented as finalized at this stage. Future mechanisms will be communicated as the relevant products and infrastructure are developed.

# Technology

## Blockchain Infrastructure

Blockchain: Solana
Token Standard: SPL
Launch Platform: Pump.fun

The current $WDC token operates on the Solana network.

Solana provides the underlying blockchain infrastructure for the current token and allows the project to build within an established ecosystem of wallets, applications, markets, and developer infrastructure.

## Contract Address

```
7pZbygKjTfMy1gdUKCZCuMQsR1ptA5ti5Zastnm7pump
```

Participants should always verify the contract address before interacting with the token.

# Ecosystem Infrastructure

Future infrastructure may include additional web applications, wallet integrations, APIs, community tools, product interfaces, and other supporting systems.

The technology layer will evolve according to the requirements of the ecosystem. The objective is not to build complexity for its own sake. It is to build infrastructure that supports real products and real users.

# Security & Trust

- Publicly verifiable token information
- Transparent token structure
- Clear distinction between current and future development
- Contract-address verification
- Progressive infrastructure development

Additional security measures may be introduced as the ecosystem expands. Where third-party audits or other verification processes become appropriate, they will be pursued and communicated publicly.

# Governance

A future community governance structure may be explored as the ecosystem matures.

- Community proposals
- Voting mechanisms
- Transparent decision-making
- Community initiatives
- Ecosystem contribution programs

Governance is not being presented as an active feature of the current token. It is a potential future direction that depends on the size, maturity, and needs of the ecosystem.

# Competitive Position

## History

The World Coin name has existed within cryptocurrency since 2013.

## Public Launch

The current $WDC was launched publicly without a presale or stated team/investor allocation.

## Community Ownership

The project is being developed around community participation rather than a traditional venture-backed structure.

## Transparency

The project distinguishes clearly between what exists today and what remains under development.

## Ecosystem Approach

WDC is not being locked into a single application before the ecosystem has had the opportunity to discover what works.

# Risks & Considerations

## Market Volatility

The price of $WDC can fluctuate significantly and may lose substantial or all of its value.

## Execution Risk

Building an ecosystem requires time, technical development, resources, and consistent execution.

## Adoption Risk

The success of future products and initiatives depends on whether users choose to participate.

## Development Risk

Not every experiment or product direction will necessarily succeed.

## Regulatory Risk

Cryptocurrency regulations differ between jurisdictions and may change over time.

## Technical Risk

Blockchain infrastructure, smart contracts, applications, wallets, and third-party services can experience technical failures or vulnerabilities.

Participants should conduct their own research and understand the risks before interacting with $WDC.

# Legal Disclaimer

This document is provided for informational purposes only and does not constitute financial, legal, tax, or investment advice.

Nothing contained within this document should be interpreted as a guarantee of future performance, value, adoption, development, or profitability.

Cryptocurrency markets are highly volatile and participation involves substantial risk. Users are responsible for conducting their own research and complying with applicable laws and regulations in their jurisdiction.

# Conclusion

World Coin ($WDC) begins with an unusual foundation: a name with history, a new token on Solana, and a community willing to see what can be built from it.

The current project does not claim that its final form has already been decided. Instead, WDC is taking a more deliberate approach.

Build the foundation. Develop the ecosystem. Listen to the community. Test what works. Improve what does not. Then scale what earns its place.

The original World Coin was part of cryptocurrency's early history. The current $WDC is a new chapter.

Where that chapter ultimately leads will be determined not by a document alone, but by what gets built and what people choose to use.

No shortcuts. No manufactured certainty. Build in public.
